About Figma

What is it?

Figma is a vector graphics editor and prototyping tool that is web-based with additional offline features for desktops.

What is it used for?

It can be used to build prototypes of applications or websites on various screen sizes, creating style guides, whiteboarding with a team, and more! You can document your workflow, comment, share, and edit with a team. Figma allows you to export components and shows you snippets of the code behind your design. This allows an easier transition between the design and development team.

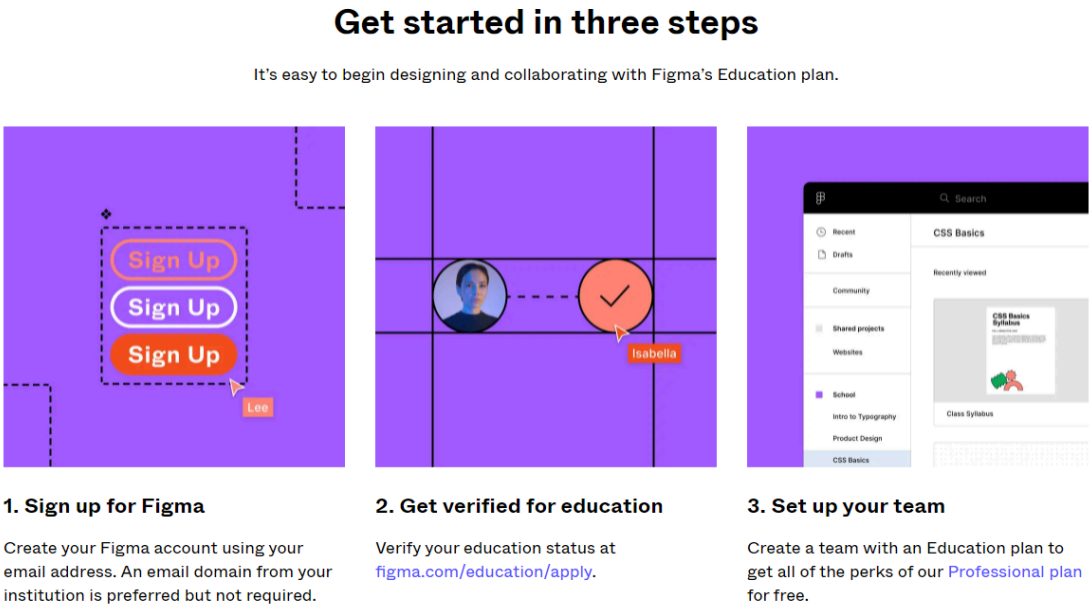

Getting a Figma Account

Payment Plans

For our purposes in these workshops, the free account is just fine! If you end up wanting to get a paid subscription for more features, you can check out the different options here.

Student Account

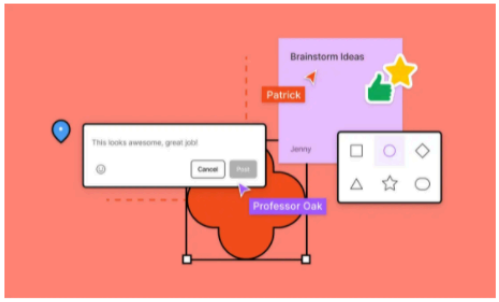

We won't go into verifying your student status in this workshop, but feel free to go ahead and use your student email when signing up. That way, you can always go back and verify with the steps below. Click on the image to visit Figma's site.

Our Web Team

Our Web Team for Girls Who Code at UNCC has been granted access to the educational plan where we can have a free team on Figma. We will use this to create our own style guide and reusable components that can be incorporated to our current website template. If you're interested in joining our team and helping work on this, you're in the right place! We will have 3 parts to this workshop series to get us acquainted with Figma and start using it as a team. **Make sure you use your UNCC email when signing up so you can be added to our team later.

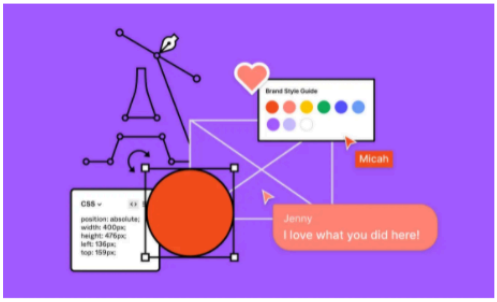

With the Education plan, you can design and collaborate with others, without limits

Educators

Manage a virtual classroom space for your students and visually collaborate with your colleagues. Create education teams to manage each class, facilitate visual activities, and deliver content.

Learn more

Students

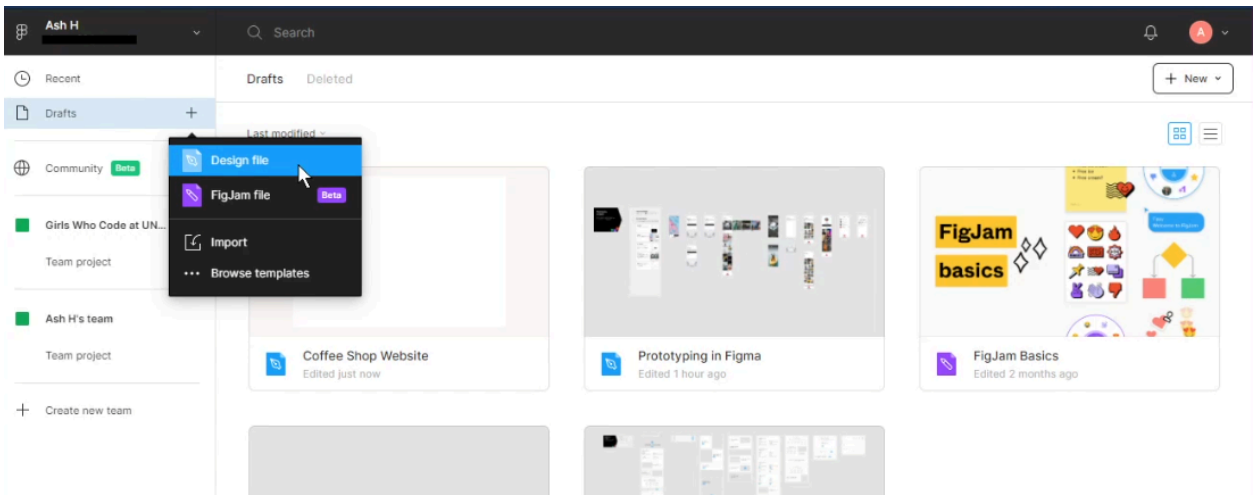

Collaborate and design with your classmates, organize your process, and showcase your work. Ideate, design, iterate, prototype, and present. You can do it all in Figma.

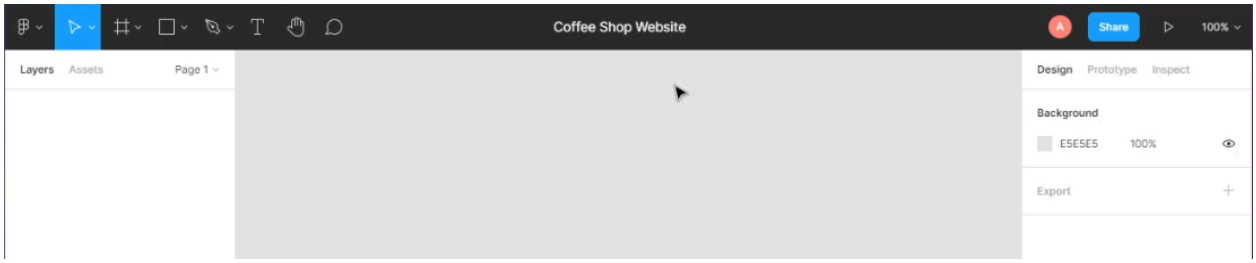

Learn more

Getting Started

Below are a few of the basic things you can do with Figma in general. See the next section for more common actions that are helpful when building a prototype.

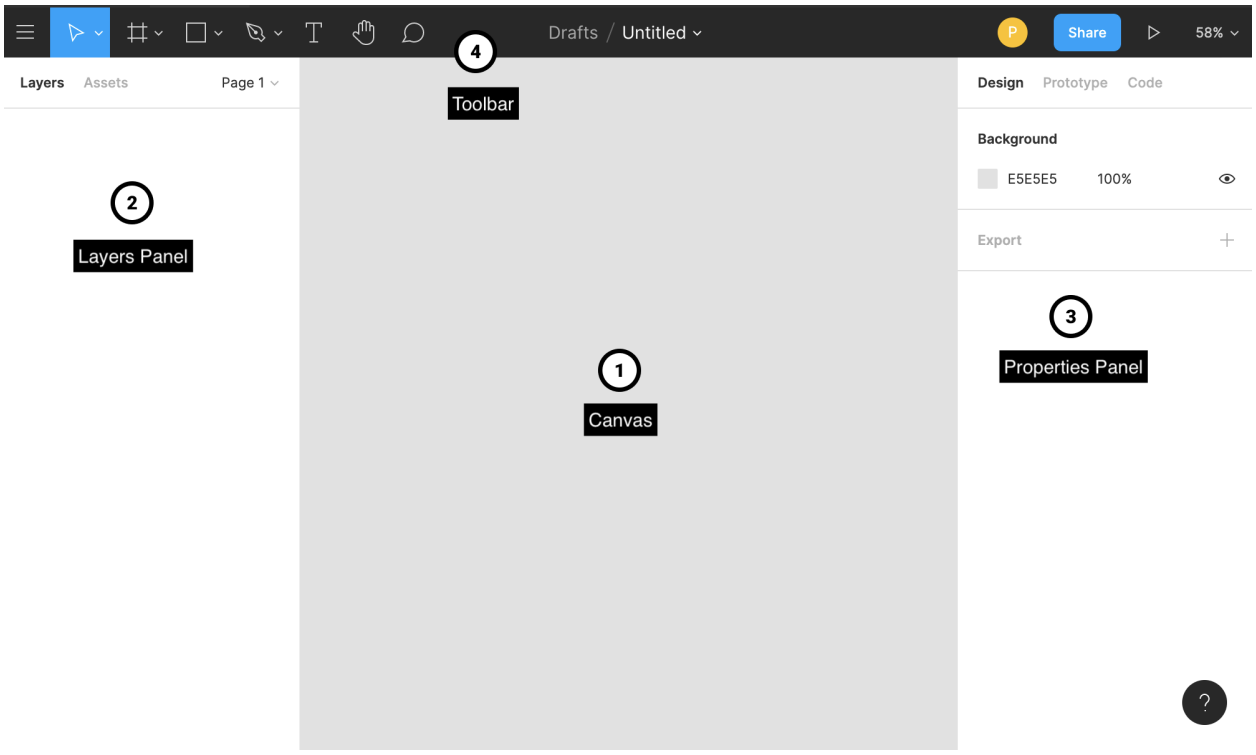

Creating a New Project

Learning the Interface

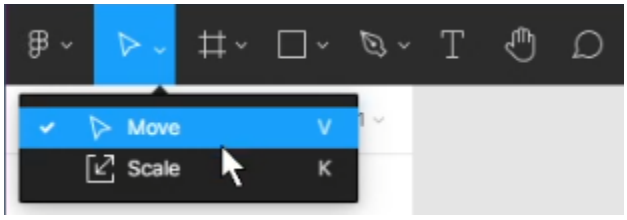

Below are the basic sections of your Figma workspace that we will work with. Click the image below to see a much more detailed breakdown.

Move Tool

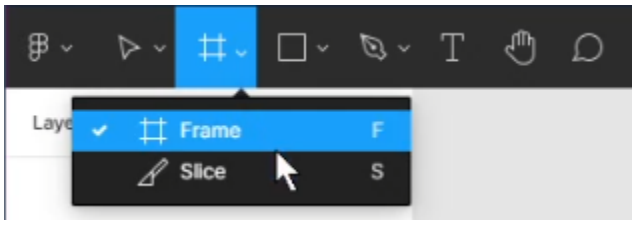

The move tool is essentially a select tool. You can grab and move items as a whole or select groups of items. You can also click on points of a selected item to drag out those, resizing or shaping the item.

- Inside of a selected item, you will also see a small dot inside each corner that you can click, hold, and drag in and out (or left and right) to edit the curve of those corners

Frame Tool

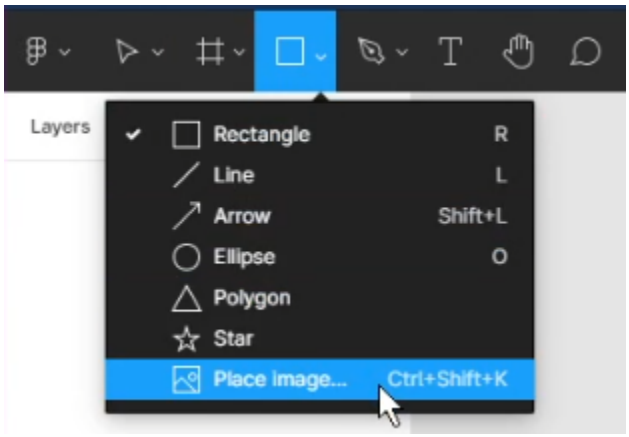

Selecting the frame tool will cause frame options to pop up in the right side panel. Here is where you can pick the size of your frame or page to add to your canvas. For example, a mobile frame or a desktop frame. These frames are called artboards, but for the purpose of this workshop and creating a website prototype, I will refer to them as pages.

Shape Tool

This tool allows you to select various shapes to add, as well as the option to place an image.

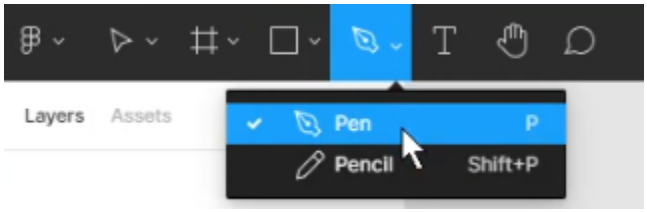

- Images can be placed within shapes, text, and more and snap to fit that item.

Pen Tool

Using the pen tool, you can click and draw lines with multiple points or angles.

- Hold SHIFT + Drag the line around to get angle increments of 15 degrees or so
- To create multiple connected line segments
    - Click to start your line and move your mouse the distance you want the line to go
    - Click again to end that current line segment
    - You can repeat the process for as many line segments as you want
- Hit ESC to stop adding line segments
- If you want to create a curve
    - Click to start your line and move your mouse the distance you want the line to go
    - When clicking to end the current segment, hold that click and drag your mouse pointer around

Text Tool

When the text tool is selected, you can click anywhere on the canvas and start typing text. In this case, the text box will form around your text, and you will need to do your own resizing.

- If you want a specific size/shape text box, click and drag out a box and then begin typing
- You can always resize the text box later with the scale tool found under the move tool

Grab Tool

You can use this to grab the canvas (without selected items) and move it around.

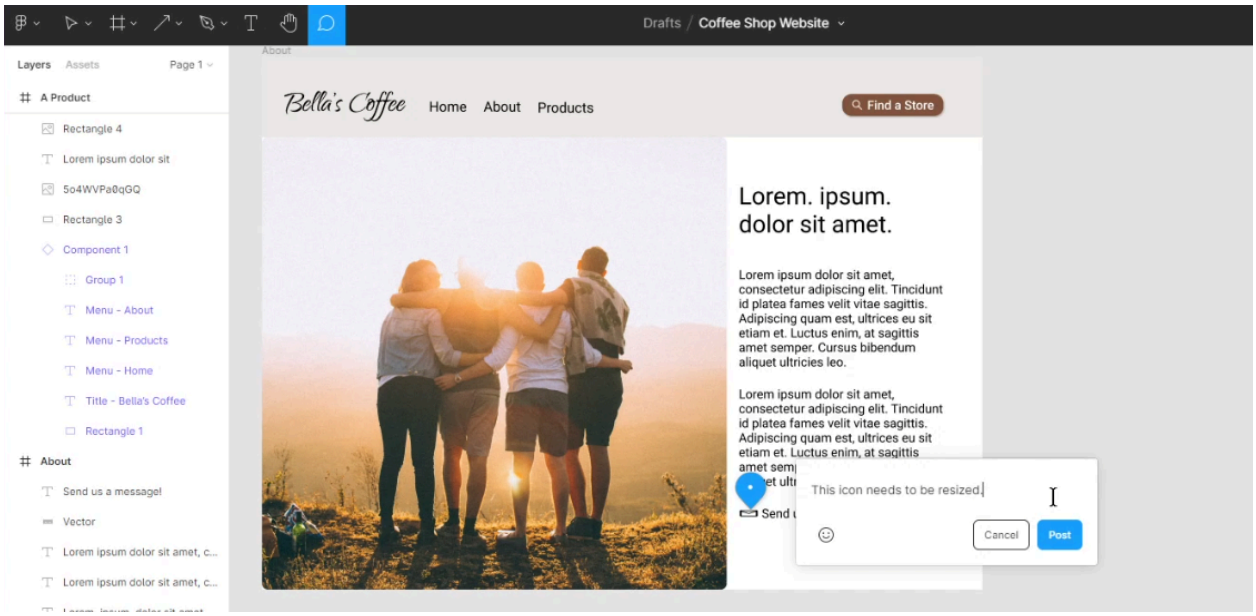

- Another way to move around is to use the spacebar
    - This way automatically goes back to the move tool when you let go

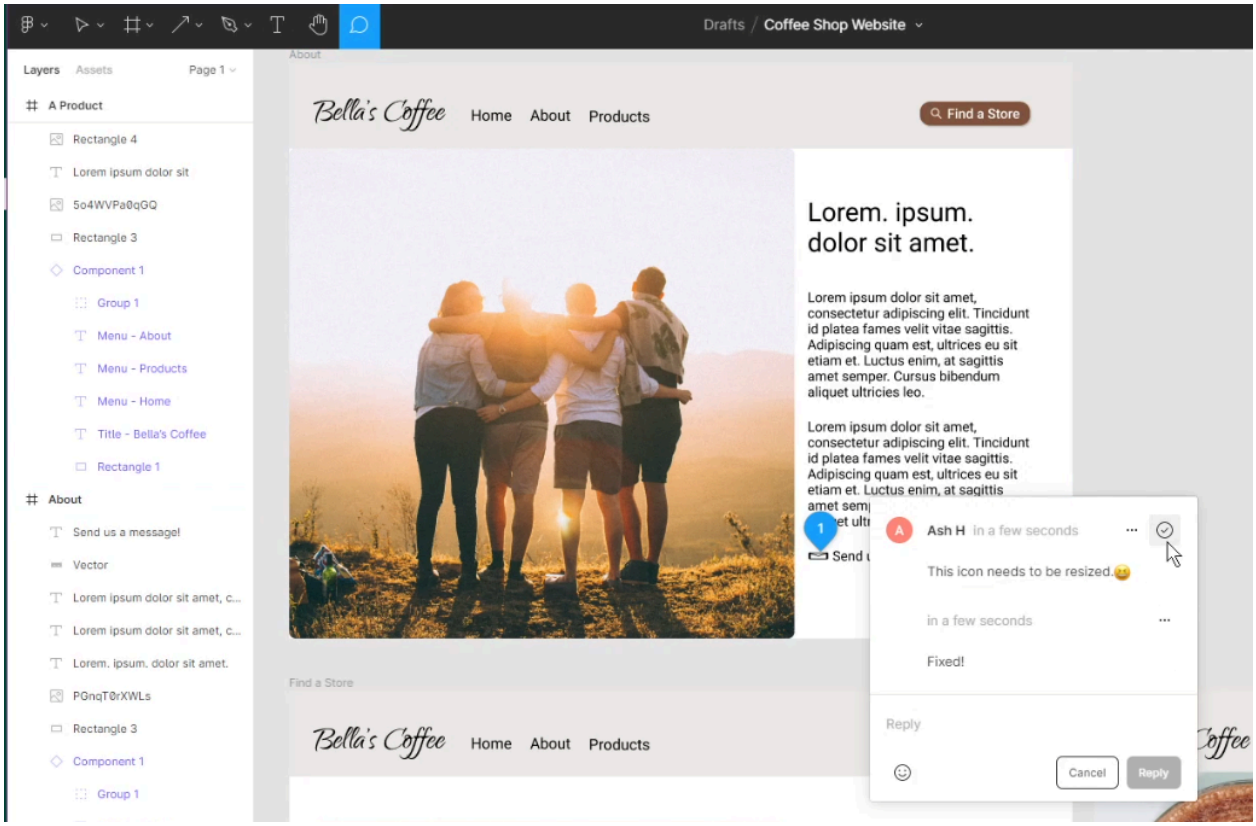

Comment Tool

When the comment tool is selected, simply click on any location on the canvas to type a comment.

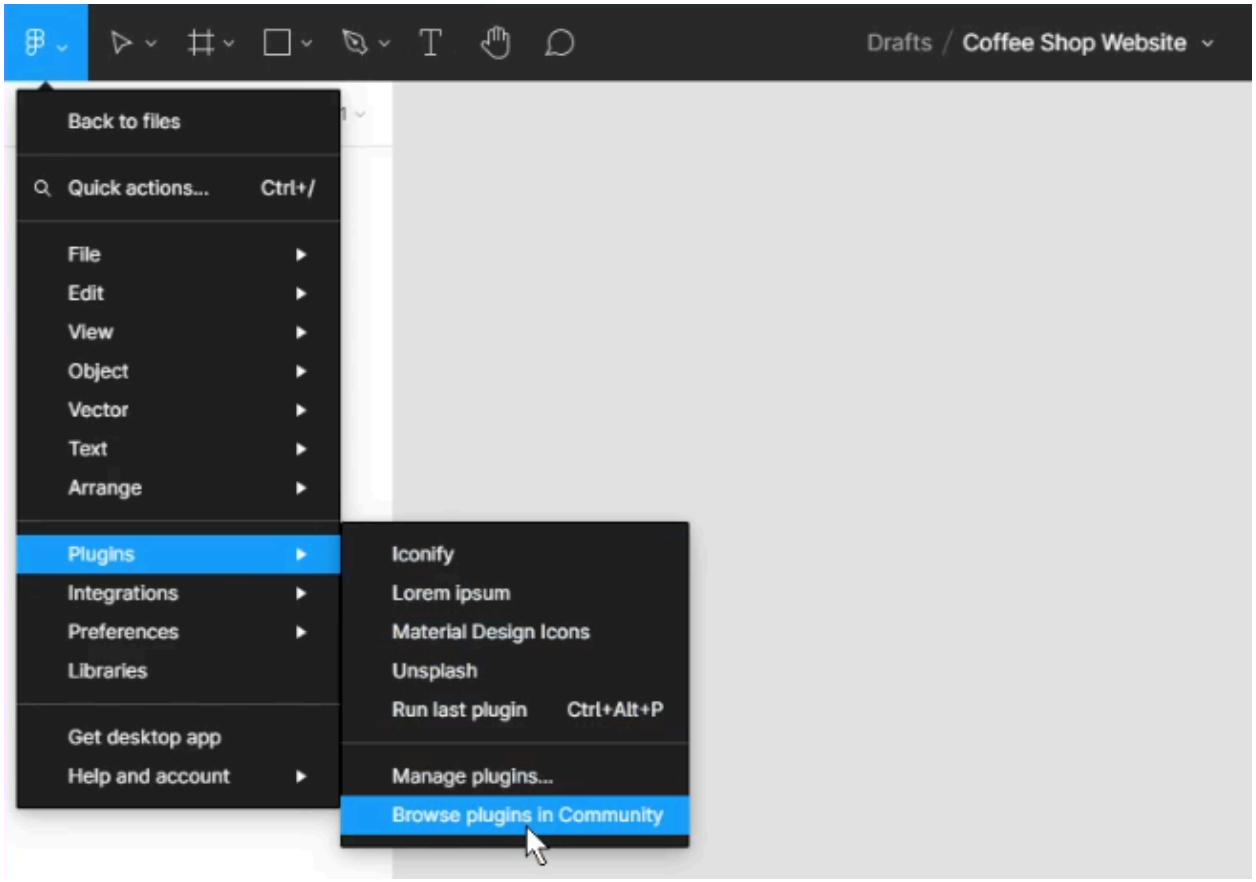

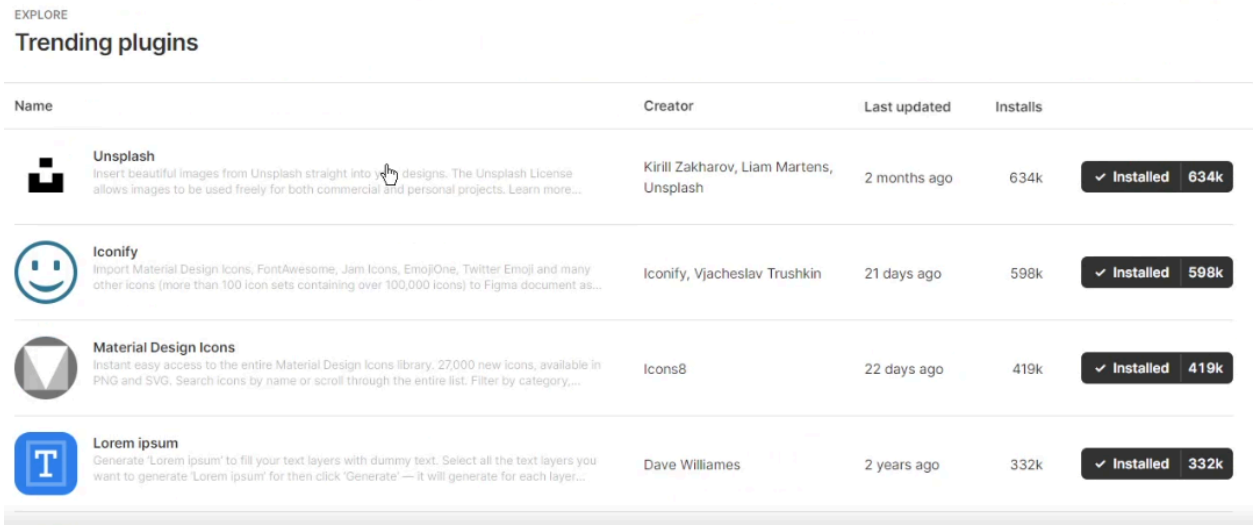

You and any others who have access to this project can reply to this comment or mark it as resolved using the icon in the top right corner of the comment thread.

Getting Plugins

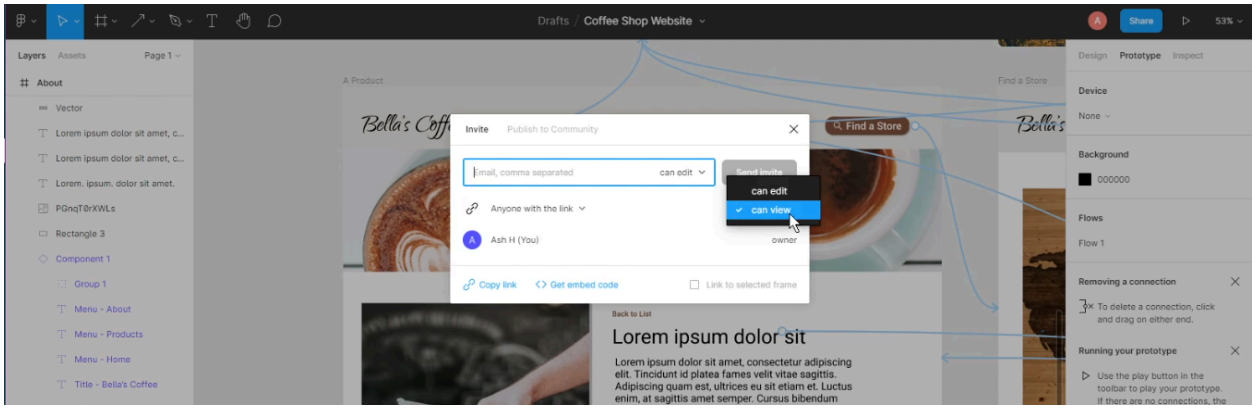

Plugins are extremely useful to increase efficiency of your workflow. You can explore the plugin community for any that you are interested in. For this workshop, I recommend installing those shown in the second image (with the exception of Google's Material Design - unless you just want that for later). For other cool things you can use, check out [UI Goodies.]

Share Your Project

While working on your project, or when you're finished, Figma allows you to share it with others. You can give them view or edit access. You can also embed your project somewhere else for others to view. For example, if you wanted to include it in a portfolio.

Common Actions

Below are some common actions you will use while working in Figma, especially in this workshop to create a prototype. No need to memorize these, feel free to refer back to this section whenever you need to!

Note: There are multiple ways to do some things, as well as shortcuts for many actions. So what is listed is just one or two ways to do that particular action. Feel free to explore all the ways you can do these and start implementing short cuts!

Layers

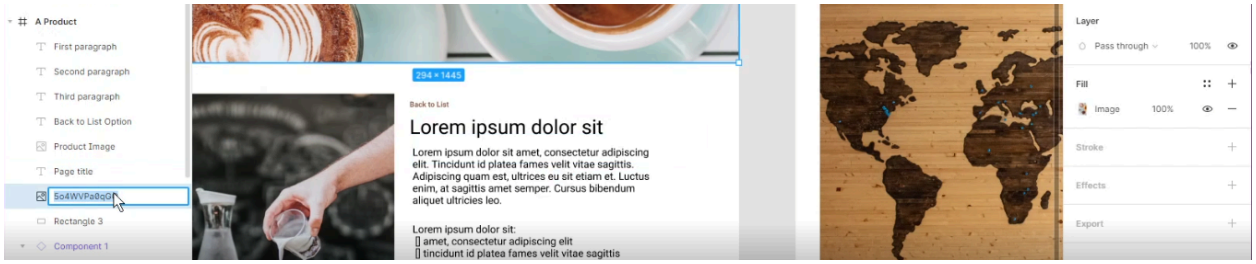

Layers are what gets created every time you add an object, whether that is text, shapes, images, etc. Depending on what is selected when adding an object, these layers will appear under the frame or page you added them to (ie. Home page or About page of a prototype), or at the top of the Layers Panel. These are important to keep organized.

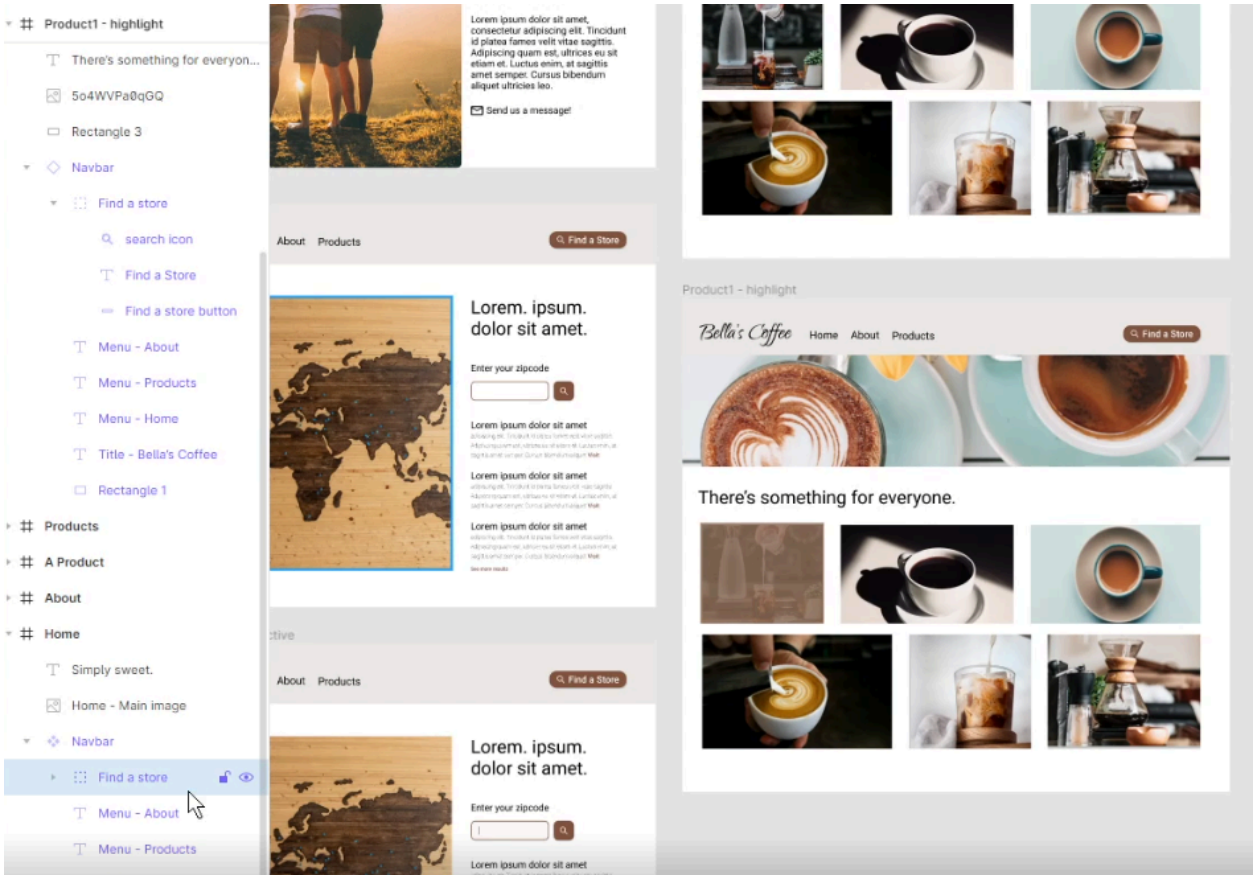

Naming

When new layers are added, make sure you name them as soon as possible. Give them a meaningful name that will be helpful in knowing what object that layer is for at a quick glance. Once you start putting items into groups, or making an item a component, make sure to also name that component or group.

- To name a layer, double click on it and type/edit the name

An example of a group can be seen with the component "Navbar" in the image below. (Components are shown in purple) The Navbar contains all elements in the menu bar of the website prototype: Title, menu options, find a store button, etc.

Sorting

If you are ever unsure which layer goes to certain items, or even which page is what (pages have the bigger titles and # symbols in the Layers Panel), you can click on a layer and see what is selected on the canvas.

Ordering

The order your layers are in automatically determines what objects are on top of others. If you want to change this, you can grab a layer and drag it above or below another layer to bring that layer forward or backwards in terms of view.

- This can also be accomplished by selecting the item on the canvas directly, right clicking, and choosing to bring forward or backwards

Locking

If you have a layer you won't need to mess with anymore, or you don't want it getting selected as you move other things around, you can lock that layer by clicking the lock icon on the layer.

Zooming/ Moving

Zooming is similar to most other applications.

- Windows: CTRL + or CTRL -
    - Can also use CTRL and mouse scrolling to zoom in and out on a particular spot
- Mac: CMD + or CMD -
    - Can also use CMD and mouse scrolling to zoom in and out on a particular spot

Resizing Objects

To resize an object while keeping its aspect ratio, you can hold SHIFT while using your mouse to click on a corner and drag it in or out to the size you want. If you don't hold SHIFT while doing this, the shape/aspect ratio will not be constrained.

Creating Components

A component is a reusable element. We want to make things we will use often or want the same look/size/etc components. For example, a navigation menu at the top of a website usually stays consistent across pages. To make something a component, select the items you want, right click, and select Create Component. These items should now be grouped under the name "Component" in the Layers Panel and appear in purple. You should rename the component to something relevant.

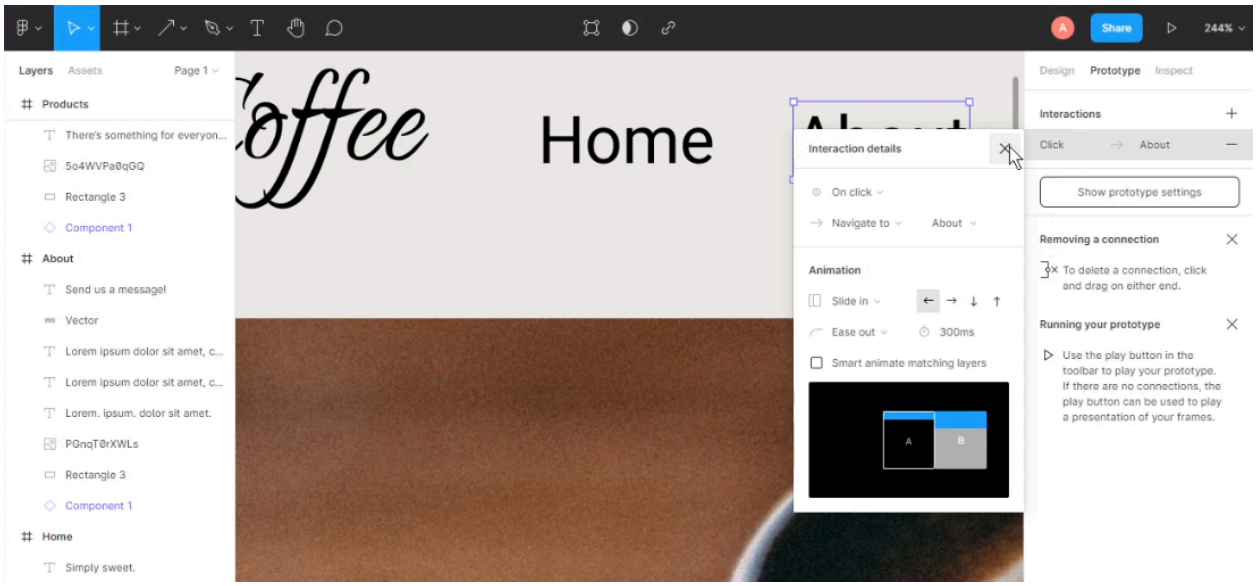

Now whenever you make changes to that original component, any copies elsewhere on the canvas will also get those changes. If you need to change a copy of a component on a given page, you can still do that without affecting the original component. However, be aware any changes to the original component will affect all other copies.

Duplicating Objects

You can easily duplicate pages or objects with CTRL C and CTRL V. You can select an entire page to copy by using the Layers Panel on the left to select the page name and then using CTRL C and CTRL V. Make sure you rename your copy so you know what it's for.

Transitions

Transitions are used to showcase moving through different pages of your prototype. We can select an item, click on the Prototype tab in the Properties Panel on the right, and add an interaction. Then you can select what the interaction is, what it should do when that interaction happens, and how it should do it.

Placing Images

Images can be placed in a couple ways depending on what you want to do.

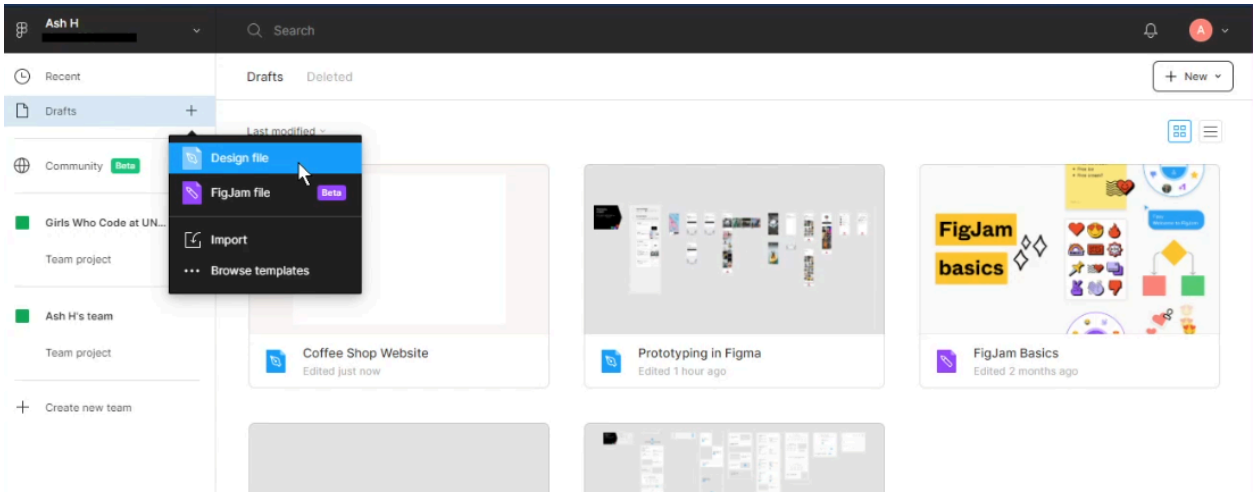

- If using an image from your own files that you want to place in the canvas regularly, just drag and drop it into Figma
- If you want to place an image inside of a shape or object (even as text colors!), select place image from the shape tool menu, select the image you want, go to where you want it and click the object
- If you want it to automatically place the image in a shape or object, select that object, then choose a photo and double click to insert it into the selected space

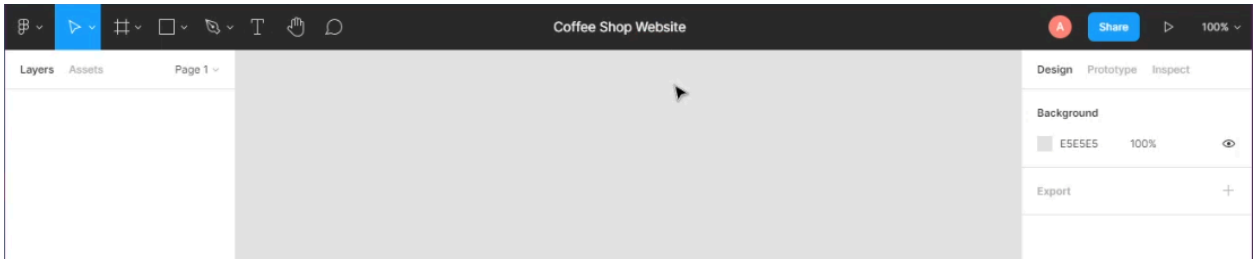

Note: These steps may change slightly depending where you are selecting images (plugin vs desktop files), but the concepts are the same. Some trial and error can help get the hang of it.

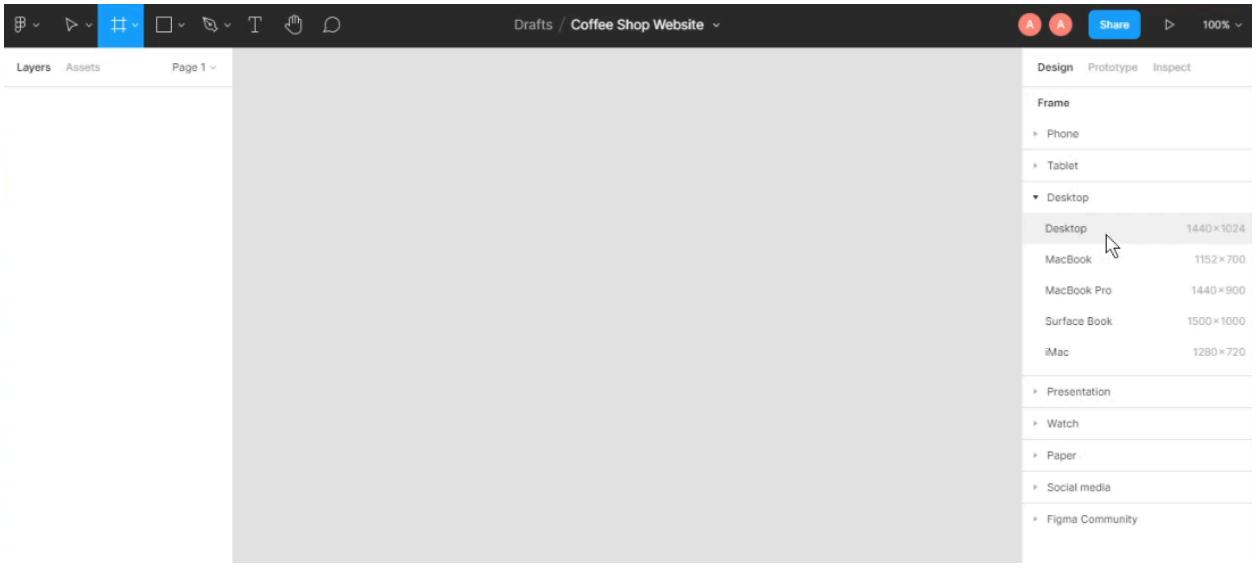

Build a Prototype

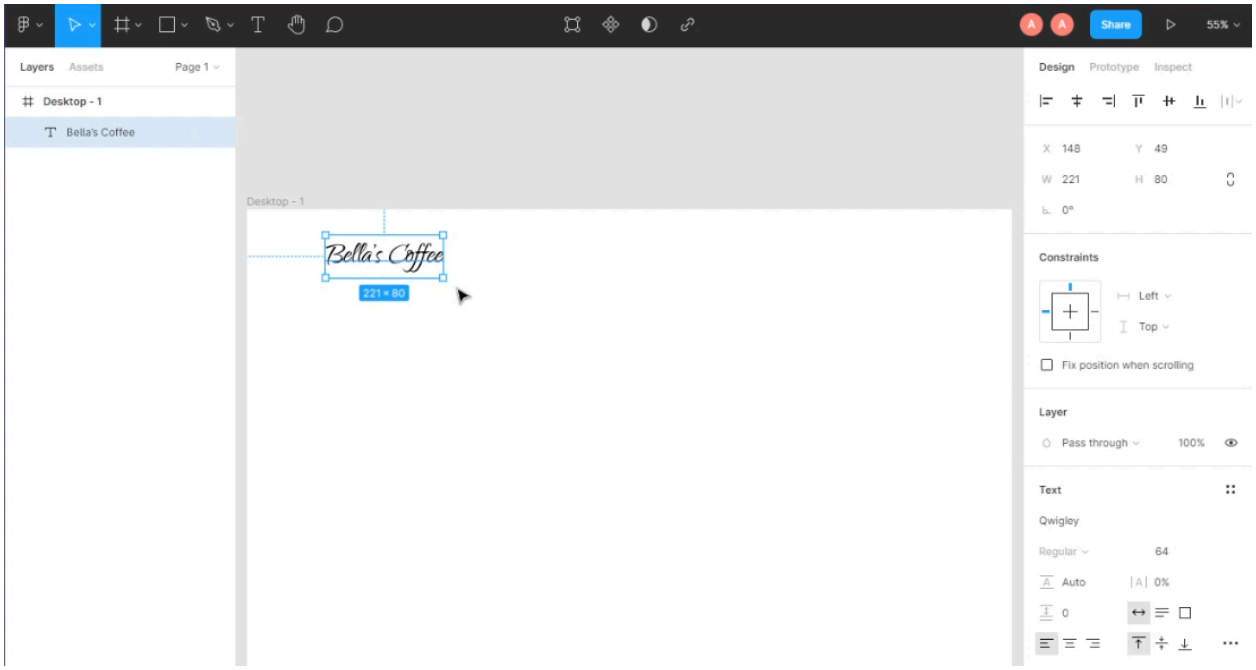

In this workshop, we walk through building a prototype for a simple coffee shop website. This website is not taking many design principles into account or paying too much attention to colors. It is solely for learning how to use Figma in general. In the next workshop, we will look a bit more at design principles and taking our prototype to the next level.

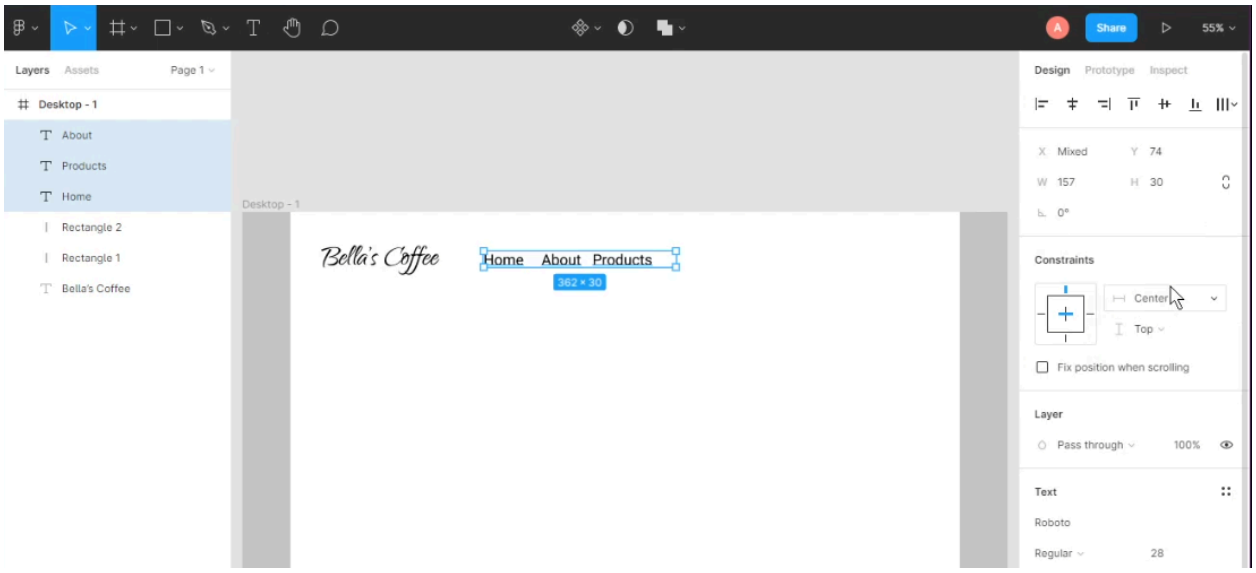

****Note: Currently the images below do not have steps or comments, they are just here for visual reference. This section will be completed later. See the recording for a detailed follow-along.****

Creating a connection
Select a frame or object in a frame and use the circular node to drag a connection to another frame.
Running your prototype
Use the play button in the toolbar to play your prototype. If there are no connections, the play button can be used to play a presentation of your frames.
